

Shift Visualisations

Shift visualisations are designed to show bitwise shift operations via animation. This operation is unique for each shift instruction `LSL`, `LSR`, `ASR`, `ROR`, `RRX`. See the [list of supported instructions](#) for details. The visualisation can be viewed by using the button `Show Shift` that automatically appears when needed, or by using the keyboard shortcut `Shortcut+Alt+S` if the visualisation has been disabled via the [settings panel](#).

`Shortcut` is `Ctrl` for Windows and Linux, and `Cmd` for Mac OS X.

The following information is provided in the shift visualisations:

Item	Description
Original bits	Bits part of the original value that has been shifted
New bits	New bits inserted as a result of the shift operation
Carry bit	The value of the <code>C (Carry)</code> condition flag
Original value	The value to shift
New value	The value obtained as a result of the shift operation
